BB503/BB602 - R Training - Week XIII

Ege Ulgen

Simulated Data

Consider the following linear regression model:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{1i} X_{2i} + Z_i$$

We'll simulate Y values for n = 1000 subjects using the following configuration:

- $\beta_0 = 1$, $\beta_1 = 0.8$, $\beta_2 = -1$, $\beta_3 = 0.3$
- $X_1 \sim Normal(20, 5)$
- $X_2 \sim Bernoulli(p = 0.5)$
- $Z_i \sim N(0, 0.5)$

```
n <- 1000

B0 <- 1
B1 <- 0.8
B2 <- -1
B3 <- 0.3

set.seed(123)
X1 <- rnorm(n, mean = 20, sd = sqrt(5))
X2 <- sample(c(0, 1), size = n, replace = TRUE)
Z <- rnorm(n, mean = 0, sd = sqrt(0.5))

Y_sim <- B0 + B1 * X1 + B2 * X2 + B3 * X1 * X2 + Z

simulated_df <- data.frame(Y = Y_sim, X1 = X1, X2 = X2)</pre>
```

We'll compare the estimated mean squared errors (MSEs) for two models (below) using 3 different approaches:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \beta_3 X_{1i} X_{2i} + Z_i$$

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + Z_i$$

The holdout method

```
set.seed(123)
train_idx <- sample(1:nrow(simulated_df), nrow(simulated_df) * .8)

train_df <- simulated_df[train_idx, ]
test_df <- simulated_df[-train_idx, ]</pre>
```

```
# fit model on training
fit1 <- lm(Y ~ X1 + X2, data = train_df)
fit2 <- lm(Y ~ X1 + X2 + X1 * X2, data = train_df)

# predict on test
preds1 <- predict(fit1, newdata = test_df)
preds2 <- predict(fit2, newdata = test_df)

# calculate MSE
MSE_holdout1 <- mean((test_df$Y - preds1) ^ 2)
MSE_holdout2 <- mean((test_df$Y - preds2) ^ 2)</pre>
```

K-Fold Cross Validation

```
### 10-fold CV
K <- 10
set.seed(123)
# shuffle
idx <- sample(1:n, n)</pre>
kfold_df <- simulated_df[idx, ]</pre>
kfold_df <- cbind(kfold_df, fold = rep(1:K, each = 1000 / K))</pre>
all_MSE_kfold1 <- all_MSE_kfold2 <- c()</pre>
for (i in 1:K) {
    train_df <- kfold_df[kfold_df$fold != i, ]</pre>
    test_df <- kfold_df[kfold_df$fold == i, ]</pre>
    # fit model on training
    fit1 <- lm(Y ~ X1 + X2, data = train_df)</pre>
    fit2 <- lm(Y ~ X1 + X2 + X1 * X2, data = train_df)
    # predict on test
    preds1 <- predict(fit1, newdata = test_df)</pre>
    preds2 <- predict(fit2, newdata = test_df)</pre>
    # calculate MSE
    MSE1 <- mean((test_df$Y - preds1)^2)</pre>
    MSE2 <- mean((test_df$Y - preds2)^2)</pre>
    all_MSE_kfold1 <- c(all_MSE_kfold1, MSE1)</pre>
    all_MSE_kfold2 <- c(all_MSE_kfold2, MSE2)</pre>
MSE_kfold1 <- mean(all_MSE_kfold1)</pre>
MSE_kfold2 <- mean(all_MSE_kfold2)</pre>
```

Leave-one-out Cross Validation (LOOCV)

```
### =1000-fold CV
K <- nrow(simulated_df)
set.seed(123)
# shuffle
idx <- sample(1:n, n)
L00_df <- simulated_df[idx, ]
L00_df <- cbind(L00_df, fold = rep(1:K, each = 1000 / K))</pre>
```

```
all_MSE_L001 <- all_MSE_L002 <- c()</pre>
for (i in 1:K) {
    train_df <- L00_df[L00_df$fold != i, ]</pre>
    test_df <- L00_df[L00_df$fold == i, ]</pre>
    # fit model on training
    fit1 <- lm(Y ~ X1 + X2, data = train_df)</pre>
    fit2 \leftarrow lm(Y \sim X1 + X2 + X1 * X2, data = train df)
    # predict on test
    preds1 <- predict(fit1, newdata = test_df)</pre>
    preds2 <- predict(fit2, newdata = test_df)</pre>
    # calculate MSE
    MSE1 <- mean((test_df$Y - preds1) ^ 2)</pre>
    MSE2 <- mean((test_df$Y - preds2) ^ 2)</pre>
    all_MSE_LO01 <- c(all_MSE_LO01, MSE1)</pre>
    all_MSE_L002 <- c(all_MSE_L002, MSE2)</pre>
MSE_L001 <- mean(all_MSE_L001)</pre>
MSE_L002 <- mean(all_MSE_L002)</pre>
```

Final Comparison

```
# Model 1
MSE_holdout1; MSE_kfold1; MSE_L001

## [1] 0.58105
## [1] 0.57947

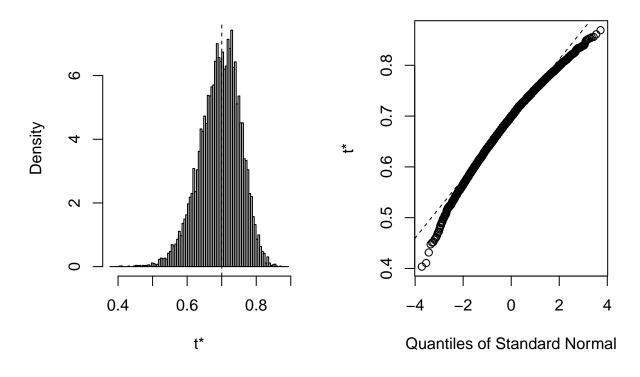

## [1] 0.5792

# Model 2
MSE_holdout2; MSE_kfold2; MSE_L002

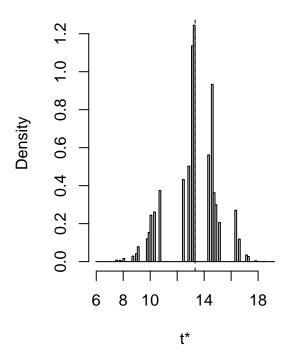

## [1] 0.48435
## [1] 0.48459
## [1] 0.48606
```

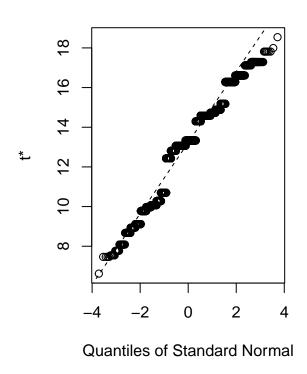

The bootstrap

```
